

Communication tester

The Click 510 serves as a powerful, cabinet-level communication debugging tool. It has the ability to emulate a SmartSensor V and to perform data integrity and data latency tests. Use it to test and find failures in communication channels.

- Includes tests for data link integrity and latency, allowing you to check communication channels
- Features SmartSensor V event data emulation
- Autobauds to serial port devices
- Mounts to a DIN rail for quick and easy installation
- Pluggable screw terminals can be removed for prewiring and are red-keyed to minimize incorrect wiring
- Results of communication tests can be monitored through computer or through LEDs on the faceplate of the device
- Remote upgradeable
- Push-button cycles through operation modes
- Conformal coated
